SAISREE DENDI

Dallas, TX | (214) 616-3779 | saisreedendi@gmail.com | LinkedIn

PROFILE SUMMARY

Software Developer with 7 years of experience building Java applications, REST and GraphQL APIs, and microservices backed by SQL and MongoDB. Builds responsive web screens and dashboards with React, TypeScript, JavaScript, HTML5, and CSS3 that connect to Java backend services, and develops Java and Apache Spark ETL pipelines using Kafka, Unix shell scripting, NDM file transfers, and AutoSys scheduling. Creates secure, HIPAA-compliant systems with FHIR and HL7 integration, TLS/AES encryption, and role-based access control, and Java test automation frameworks for driver and firmware software. Deploys and runs applications on AWS (EC2, S3, Lambda, IAM) and GCP (Dataflow, BigQuery), automates builds and releases with Jenkins and GitHub Actions, and improves quality through unit, integration, and regression testing, debugging, and code reviews in Agile teams.

TECHNICAL SKILLS

Programming Languages	Java, SQL, JavaScript, TypeScript, Shell Scripting (Bash)
Core CS Fundamentals	Data Structures & Algorithms, Object-Oriented Programming (OOP)
Frontend Development	React, TypeScript, JavaScript, HTML5, CSS3, Responsive Web Design
Backend & APIs	Node.js, RESTful & GraphQL APIs, Microservices, FHIR APIs, HL7 Standards
Databases	SQL, MongoDB, BigQuery
ETL & Data Pipelines	ETL Pipeline Design, Apache Spark, Kafka, Unix/Linux Shell Scripting, NDM File Transfer, AutoSys Job Scheduling, Enterprise Data Warehouse (EDW)
Cloud Platforms	AWS (EC2, S3, Lambda, IAM), GCP (Dataflow, BigQuery, Cloud Storage)
CI/CD & DevOps	Jenkins, GitHub Actions, CI/CD Pipeline Design, Automated Build/Test/Deploy Workflows
Testing & Quality Assurance	Unit Testing, Integration Testing, Functional Testing, Regression Testing, API Testing
Security & Compliance	HIPAA Compliance, TLS/AES Encryption, Role-Based Access Control (RBAC), Audit Logging, AML/KYC Compliance
Development Methodologies	Agile/Scrum, Requirement Gathering & Analysis, Technical Documentation, Code Reviews
Tools & Version Control	Git, GitHub, Unix/Linux, Debugging

PROFESSIONAL EXPERIENCE

Software Developer **Feb 2025 – Present**
AMD, Austin, TX

Project description: Software developer building the Java applications and services that engineers use to test and release driver and firmware software. The platform has five parts: Java test automation frameworks; a Java REST data service that collects, stores, and serves test results and performance data; React and TypeScript dashboards and a test machine management screen that show that data; Jenkins and GitHub Actions pipelines that build and test every Java commit; and AWS EC2 machines that run the tests, with S3 for results and IAM for access control.

Frontend

- Built the test results dashboard and machine management screen in React, TypeScript, HTML5, and CSS3 on Java REST APIs, showing run status, failures, and live install steps.
- Added React charts and fetch-based data loading with interval refresh and loading, error, retry, and empty states; TypeScript types catch wrong JSON fields at build time.
- Added search, filter, and sort by build, test type, or status via Java API query parameters, and highlighted failed runs with badges and a failure summary based on engineer feedback.
- Wrote shared TypeScript React components (tables, filter bars, status badges) and agreed a documented JSON format with Java developers, so frontend and backend could release independently.

Backend

- Write and maintain Java test automation frameworks with a base test class for setup, run, result check, and cleanup, using inheritance, interfaces, and reusable helpers.
- Built Java REST services that receive, validate, store, and serve test results, plus a shared Java helper library in Git and Bash machine setup scripts used by teammates.
- Ran tests in parallel with a Java thread pool, thread-safe collections, separate test data, and per-test try-catch, capping parallel tests per machine so one failure never stops a run.
- Added Java logging and nightly reports, compared test history to find flaky tests, and debugged from logs and stack traces to fix root causes, adding a test for each fix.
- Wrote unit tests for the helper library and REST services, took part in GitHub pull request reviews, and documented APIs and test setup.

Cloud

- Run Java build agents and test machines on AWS EC2 through Jenkins and GitHub Actions pipelines that compile the code and run unit, functional, regression, and sanity tests on each commit.
- Store results, logs, and history in S3 by build, machine, and date, and limit tools and data to the engineering team with IAM roles giving each service only needed permissions.
- Wrote Bash scripts to start and stop EC2 test machines on demand so we pay only while tests are queued, and keep machine and pipeline settings in Git for repeatable setup.

Environment: Java, Java REST services, React, TypeScript, JavaScript, HTML5, CSS3, Jenkins, GitHub Actions, Git, Bash, AWS (EC2, S3, IAM), Agile/Scrum

Software Developer **Nov 2023 – Aug 2024**
Citi North America - Anti-Money Laundering (AML TM), Irving, TX

Project description: Worked on the Anti-Money Laundering Transaction Monitoring (AML TM) program, which pulls customer, KYC, authorization, and daily transaction data from the bank's Enterprise Data Warehouse, checks it, and flags suspicious activity for the compliance team to review. The program has five parts: Java and Apache Spark ETL pipelines; Kafka event streaming; Unix shell scripts, NDM file transfers,

and AutoSys scheduling on RHEL Linux; React and TypeScript review screens and daily reports for analysts; and production support, including moving some pipeline parts to the cloud.

Frontend

- Built React, TypeScript, HTML5, and CSS3 screens for daily transaction and risk summaries from Spark and SQL data through Java REST APIs, plus an AutoSys job status screen for on-call.
- Built a data-quality view of records rejected by Java validation with reasons, and an alerts review screen where analysts open flagged transactions and export results for audit.
- Added search, filters, and sorting by date, customer, risk level, or alert status, with loading and error states, using reusable React components shared across review screens.
- Built daily Java and SQL reports from reusable templates, scheduled in AutoSys, and worked with analysts to choose fields, filters, and colors, updating them from feedback.

Backend

- Built Java and Apache Spark ETL pipelines that check large KYC, authorization, and transaction data in parallel, using Kafka to stream events without duplicate records.
- Automated daily data intake with Unix shell scripts and NDM transfers, and set up AutoSys jobs that start only after their files and previous job are ready.
- Wrote reusable Java validation code using collections and exception handling to reject bad records with a reason and audit trail, and used SQL joins to confirm counts match the source.
- Adjusted detection rules and limits in the Java pipeline with compliance analysts, and took part in sprints, code reviews, and release planning, documenting data flow and job dependencies.
- Kept production Java jobs and scripts running on RHEL Linux, reading AutoSys and Spark logs on call, fixing the cause, and re-running from the failed step within response times.

Cloud

- Helped move pipeline parts from on-premise to AWS EC2 and S3, comparing row counts with on-premise results, and stored processed data and logs in S3 for audit teams.
- Tried GCP Dataflow and BigQuery on sample transaction data, checking results against on-premise Spark output with BigQuery SQL, and set up basic AWS monitoring to catch failures early.
- Worked with security teams on AWS IAM access that met the bank's data rules, and documented the cloud move steps and before-and-after result comparisons.

Environment: Java, SQL, Apache Spark, React, TypeScript, JavaScript, HTML5, CSS3, REST APIs, Unix Shell Scripting (Bash), Kafka, NDM File Transfer, AutoSys, RHEL/Enterprise Linux, Enterprise Data Warehouse (EDW), AWS (EC2, S3, IAM), GCP (Dataflow, BigQuery), Agile/Scrum.

Software Developer **Jan 2022 – Oct 2023**
Luma Health, Dallas, TX

Project description: Worked on a patient-engagement platform from start to finish, covering the frontend, backend, and cloud. The platform has five parts: React and TypeScript screens for patients and clinic staff; Java and Node.js services that stay in sync with medical record systems through FHIR and HL7; Java microservices on SQL and MongoDB for scheduling, reminders, and digital intake; HIPAA-compliant security with TLS/AES encryption, role-based access control, and audit logging; and AWS hosting with Jenkins and GitHub Actions deployments that keep the platform available.

Frontend

- Built responsive, accessible booking screens and intake forms in React, TypeScript, HTML5, and CSS3 with keyboard support, input validation, and clear error messages.

- Built admin dashboards with React, TypeScript, and REST APIs to manage appointments and message status, plus GraphQL-based charts of response rates and missed appointments.
- Wrote reusable TypeScript React components shared across features and ran feedback sessions with clinic staff to improve the dashboards and ease of use.

Backend

- Built two-way Java and Node.js pipelines that sync patient records and appointments with medical record systems through FHIR APIs and HL7, fixing mapping mismatches with vendors.
- Built Java microservices with REST APIs, SQL, and MongoDB for scheduling, reminders, and intake, using joins and indexes for appointment data and documents for flexible intake forms.
- Used Kafka to pass appointment and reminder events between services, with Java collections, exception handling, and validation so a bad record is rejected without stopping the sync.
- Added TLS/AES encryption, role-based access control, and audit logging in Java for HIPAA, recording who accessed which record and when.
- Wrote automated unit, integration, and API tests in Jenkins and GitHub Actions, and traced clinic-reported problems through Java and Node.js logs, fixing them with a validation check.
- Took part in sprints, code reviews, and release planning, and documented data mappings and API behavior for the team.

Cloud

- Ran Java services on AWS EC2, S3, and Lambda, using Lambda for event-driven reminder and notification jobs, with intake documents stored in encrypted S3.
- Set up Jenkins and GitHub Actions to build, test, and deploy to AWS staging first, then production, with separate settings so a release is promoted without code changes.
- Used AWS IAM roles to limit access to patient data per environment for HIPAA, with basic AWS monitoring and alerts to catch service failures early.

Environment: Java, Node.js, React, TypeScript, HTML5, CSS3, REST/GraphQL APIs, FHIR, HL7, SQL, MongoDB, AWS (EC2, S3, Lambda, IAM), TLS/AES encryption, RBAC, Kafka, Jenkins, GitHub Actions.

Software Developer **Oct 2019 – Dec 2021**
Quadrant Resource Pvt Ltd, Madhapur, Hyderabad, India

Project description: Built and released business applications and ETL pipelines in Java for client projects. The work has four parts: Java REST APIs and microservices that connect older systems to newer cloud tools; web pages for daily client reports; the SQL behind the data layer; and pipelines that move data between several databases, including support for moving on-premise data jobs to the cloud.

Frontend

- Built daily client report pages in HTML5, CSS3, and JavaScript with sortable tables and date filters, fed by Java REST APIs, with clear loading and error messages.
- Added JavaScript form checks to catch wrong dates or missing fields, and wrote SQL and Java checks comparing report data with source systems before delivery.
- Worked with business analysts to decide what each page and API response should show, matching how clients use the data.

Backend

- Built and released Java and SQL business applications using OOP, data structures, and algorithms, and Java REST APIs and microservices connecting older systems to cloud services.
- Built Java ETL pipelines across several databases with record-count checks and failure logging, and tuned SQL queries, stored procedures, and indexes using execution plans.

- Wrote Java unit tests, tested pipelines end to end with QA, joined Git code reviews and pair programming, and used Bash to automate builds and deploys.

Cloud

- Deployed and supported Java services and ETL jobs on AWS EC2 and S3, using S3 and GCP Cloud Storage as landing areas and GCP Dataflow and BigQuery to combine sources.
- Moved on-premise Java and SQL jobs to AWS and GCP with infrastructure teams, comparing run times and record counts before and after, and set up basic job monitoring.

Environment: Java, SQL, JavaScript, HTML5, CSS3, RESTful APIs, Microservices, ETL Pipelines, Git, AWS (EC2, S3), GCP (Cloud Storage, Dataflow, BigQuery), Bash, CI/CD, Agile/Scrum.

EDUCATION

Master of Science in Data Engineering
Southern Methodist University - Dallas, TX

Bachelor of Engineering in Electrical and Electronics Engineering
Stanley College of Engineering and Technology for Women - Hyderabad, India
